

ALPCHECK

WP 6 - Information System: Design and Implementation

Authors: Ing. Ernesto della Sala (NETHUN)
Ing. Eugenio Morello (CSST)
Ing. Michael Schedl (PARADIGMA)

WP6-Objective

- Statement from ALPCHECK WP5:
 - *AlpCheck is undertaking the ambitious task of initiating a process which should eventually lead to the establishment of an **informative system** for transport through Alpine area. Such an informative system will only be created through close co-operation of all Alpine countries and the European Commission.*
- WP6 design and implementation – aims to:
 - Design system
 - Road map
 - system architecture
 - technology (peripheral, central)
 - Software (central)
 - Develop system
 - Implement (pilot projects)

WP6 – road map

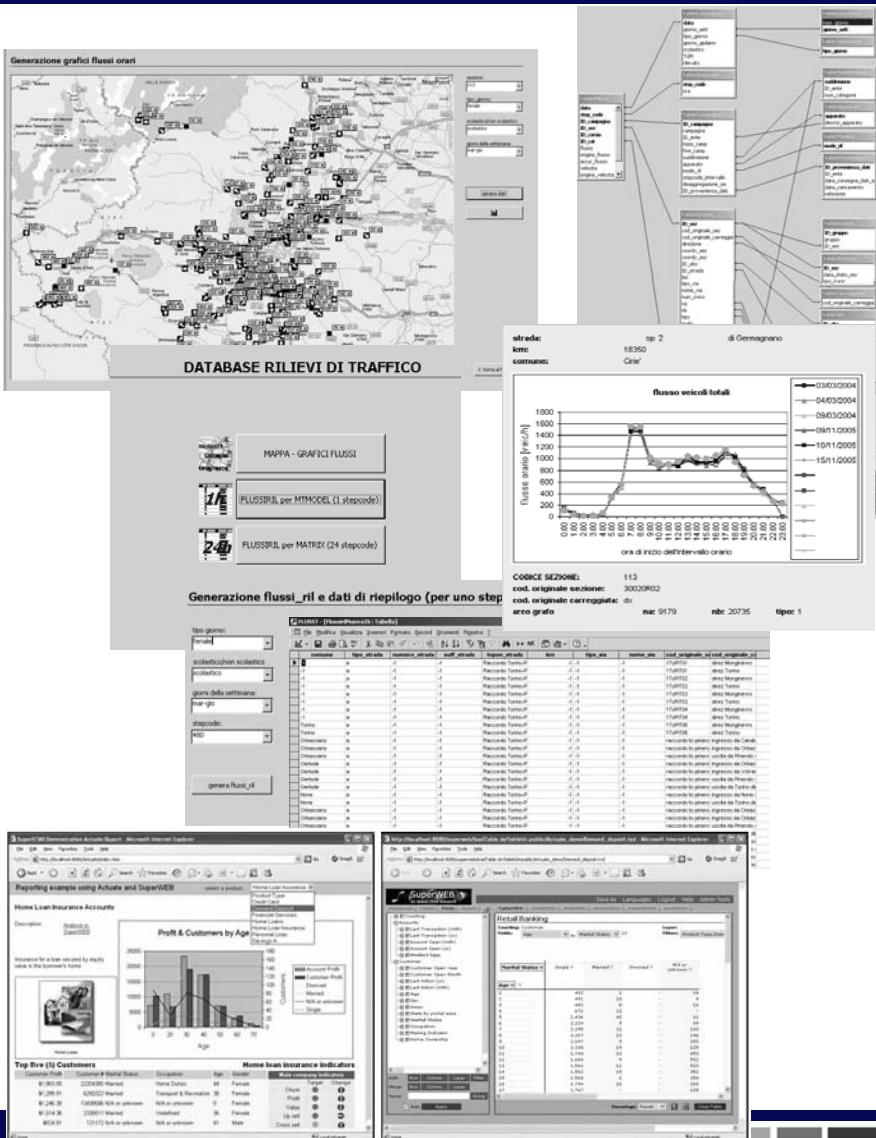

- Road map (Datawarehouse DWH)
 - First step (data base) Data transformation
 - extraction from feeder systems (ad hoc interface)
 - Transformation / normalisation
 - Data preparation and storage
 - Data interpretation and analysis (query and analysis)
- Intermediate step (Decision Support System)
 - Data interpretation and analysis (+ traffic model)
 - Data presentation (georeferenced user interface)
- Final step (Infomobility)
 - Dynamic acquisition of traffic data (including real time events)

ALPCHECK
ALPCHECK
ALPCHECK
ALPCHECK

WP6 – road map

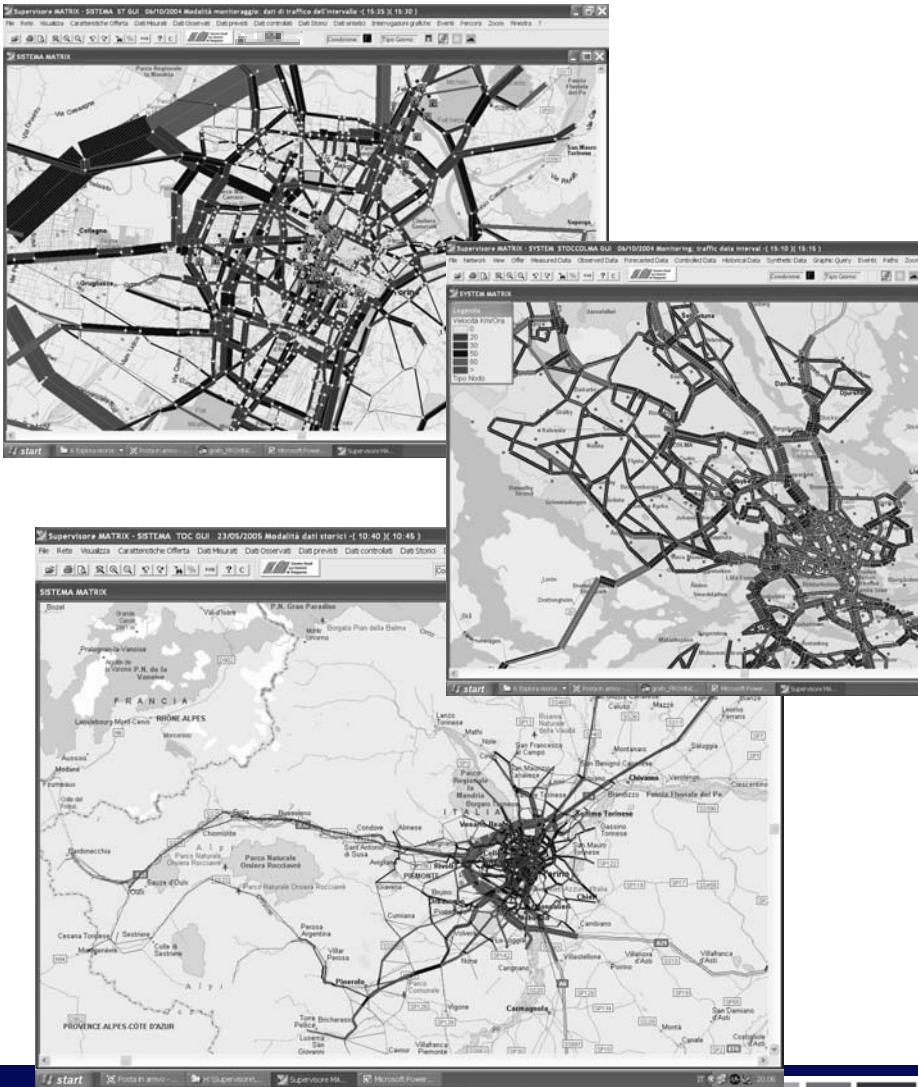

- Road map
 - First step (data base)
 - Collect traffic data from different sources
 - From data to information (Harmonize, normalize)
 - Information manipulation (query and analysis easy and flexible)
 - Data presentation (reporting)

Business intelligence
tools+web application

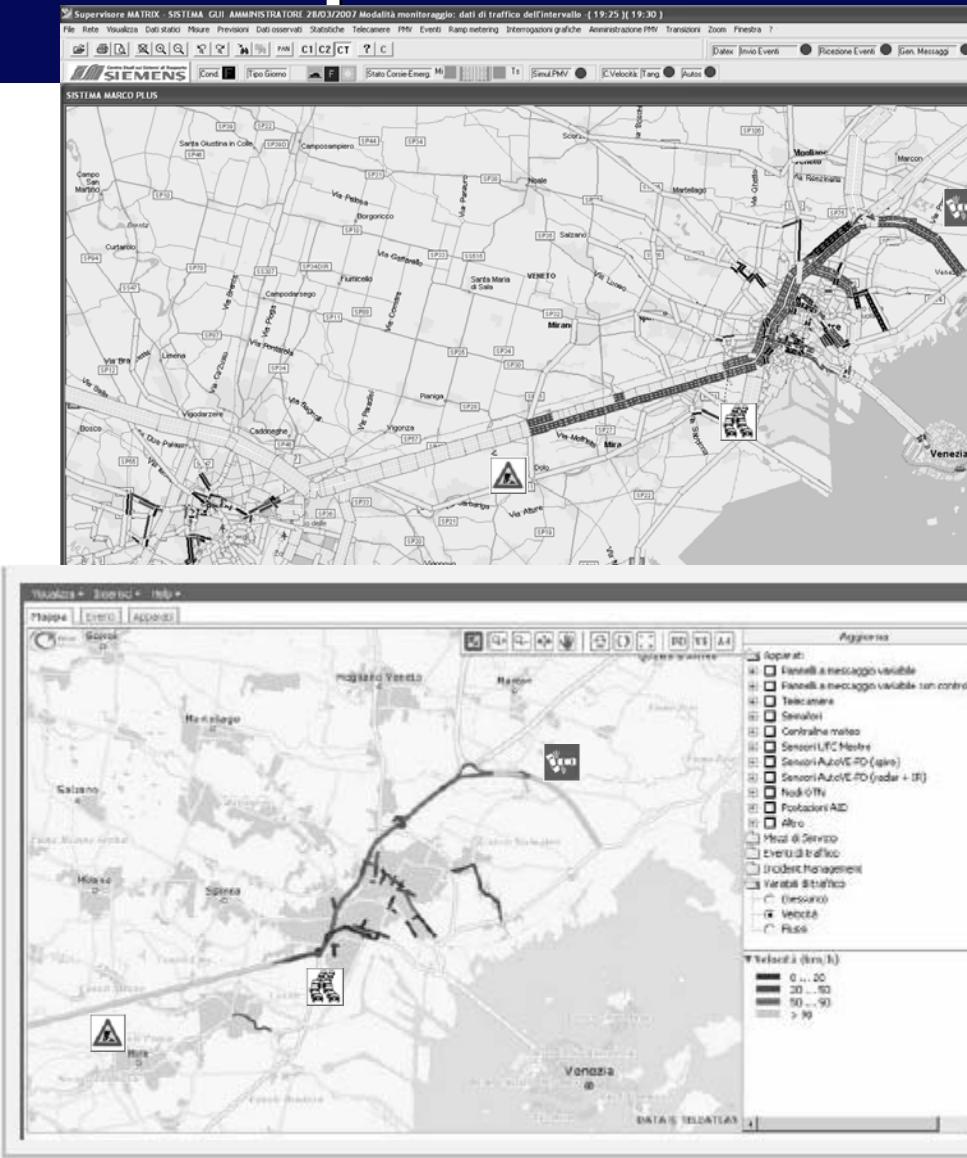

WP6 – road map

- Road map
 - intermediate step (DSS)
 - Build transport models chain
 - Offer (road network) model
 - Demand model (OD matrix time dependent)
 - Behavioural model (modal split and assignment DUE, SUE, etc)
 - Georeferenced GUI
- Model platform (dynamic)

WP6 – road map

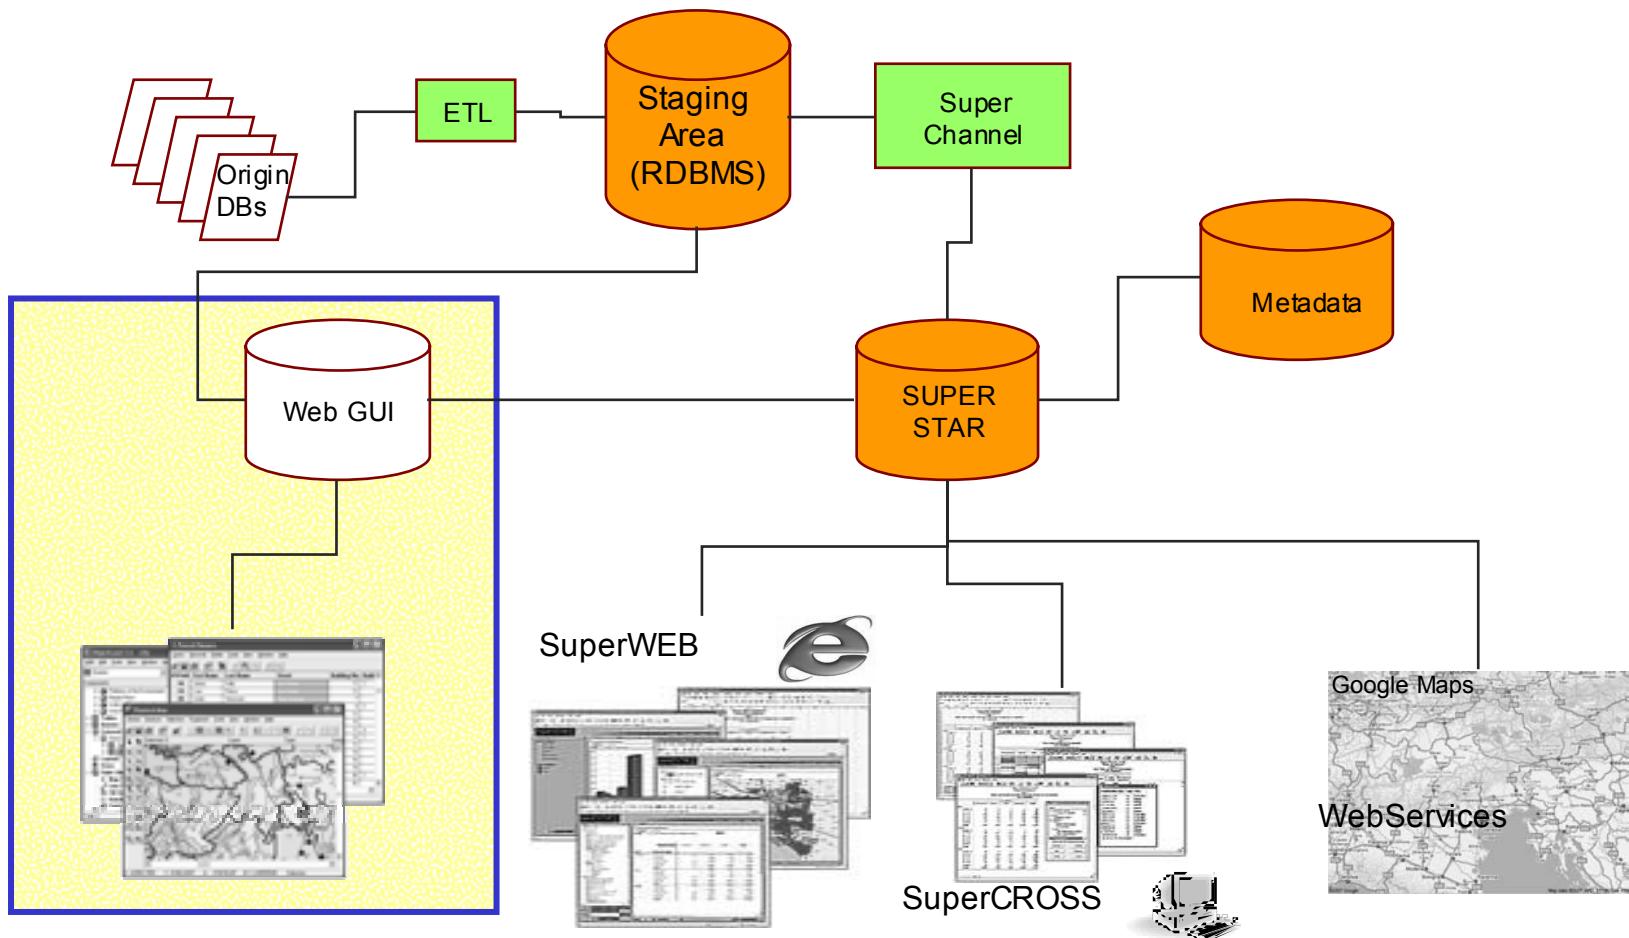

- Road map
 - Final step (infomobility)
 - Build tool working in real time
 - collecting traffic data and events,
 - making forecast on traffic evolution,
 - Generating suitable information for road users
 - Web interface
- Traffic Management & infomobility platform

WP6 – Develop System (I)

- Datawarehouse DWH (APV)
 - Selection of Tool
 - Super Star
 - Training course
 - Selection of sources
 - Traffic data so far identified
 - Pilot projects
 - Sources interfaces
 - Transformation / normalisation
- Web application (CSST)
 - Design
 - Traffic data model
 - GUI interface
 - development

System architecture

WP6 – data normalisation

- Data to be normalised
 - Road Traffic (section, stretch)
 - Flow
 - Speed/Travel time
 - Vehicle classification
 - OD (zone)
 - Intensity
 - Type
 - Passengers
 - Freight
 - Pilot project

WP6 – data normalisation

- normalisation
 - Have common view of data from different sources
 - Suitable organisation of data including “support” data = DB “tables”
- Critical issue in normalisation:
 - Time resolution
 - Vehicle classification
 - Freight classification
- Approach:
 - “Minimum common” among data
 - Minimum level of details + common group

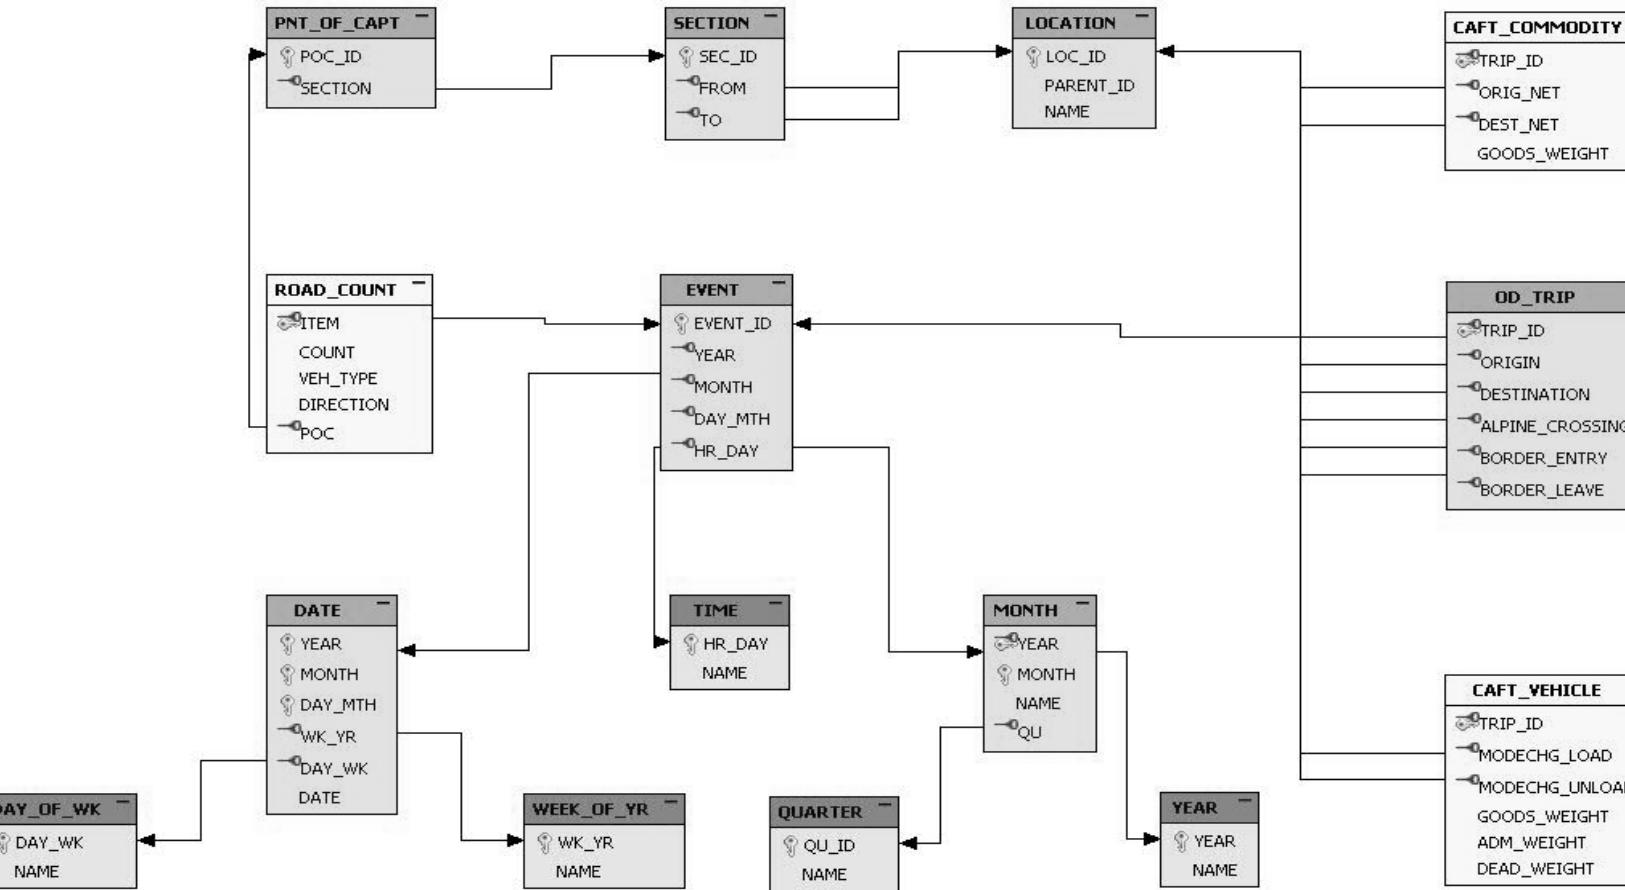

WP6 – data normalisation

- Tables
 - Static tables:
 - Source information
 - Data owner
 - Type of Vehicle classification
 - Type of freight classification
 - Time resolution
 - Data collection method
 - Traffic data
 - Section/stretch list (anagraphic info)
 - Road list
 - Calendar
 - Section group (user defined)
 - OD data
 - Zone list (NUTS, other)
 - Relation category (passenger, freight, vehicle/freight classification)

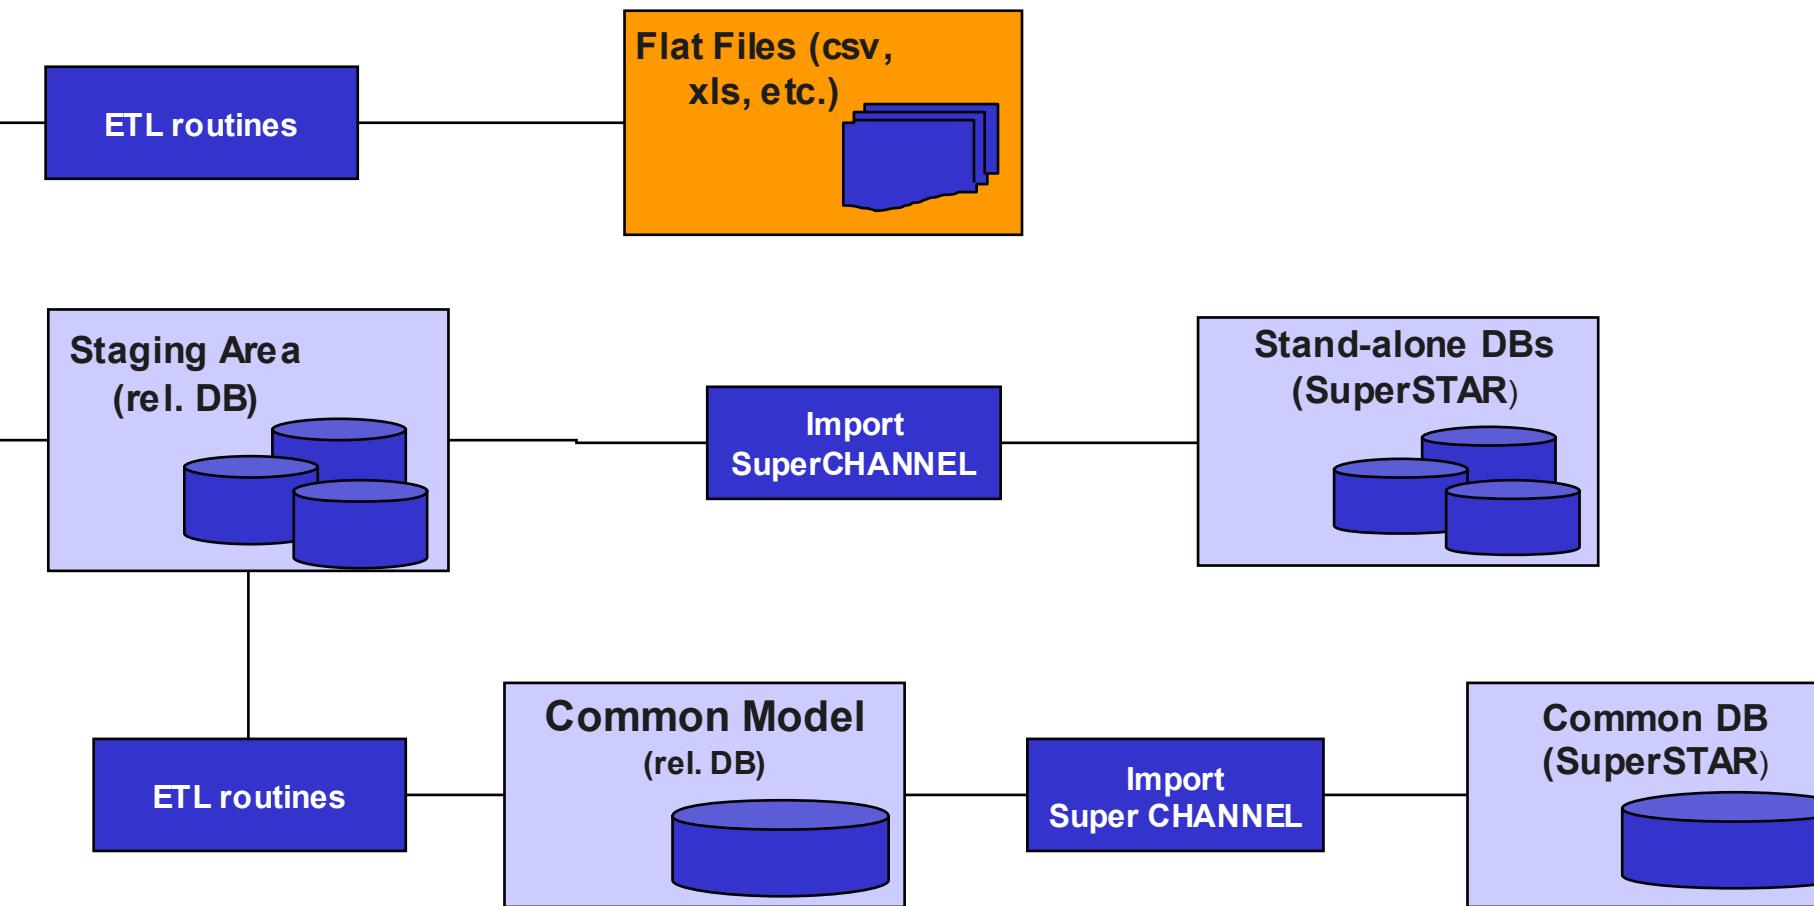

WP6 – data normalisation

- Tables
 - Dynamic table
 - Traffic data (5min/hour Resolution, per direction)
 - Flow (per vehicle category)
 - Speed (Harmonic average)
 - Type of data (measured, estimated)
 - Accuracy
 - OD data (hour/day resolution)
 - Flow (passenger/freight)
 - accuracy

WP6 – common Data model

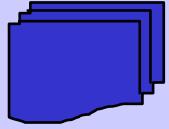

WP6 – ETL and load process design

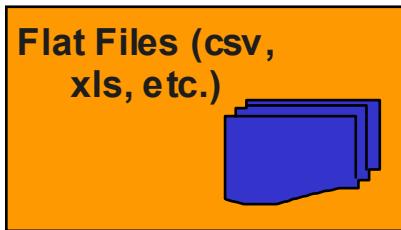

data sources – status

Flat Files
(csv, xls, etc.)

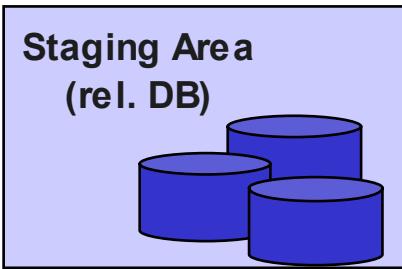

Cross Alpine Freight-Transport/BMVIT	loaded
ASFINAG	loaded
Frejus tunnel	loaded
Mont Blanc	loaded
Gran San Bernardo	loaded
Autostrade per l'Italia	loaded
Veneto Region	work in progress
Permanent automatic counting stations in Germany	loaded
Ventimiglia	loaded
Slovenia Pilot Project	loaded
Venice/Stuttgart Pilot	work in progress
IREALP - SLALA Pilot Project	work in progress
Vienna Pilot Project	no data
Val d'Aosta Pilot	no data

data sources

- Flat files
 - different formats (csv, MS Access, MS Excel)
 - Mostly well-documented
 - Some improvement in documentation possible

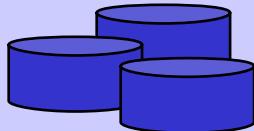

Staging Area

- One DB for each data source
- Intermediate storage for source data
- Starting point for:
 - Loading the Common Design
 - Generating separate SuperSTAR databases
- Relational databases

SuperSTAR databases

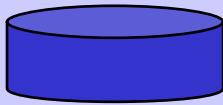

Stand-alone DBs
(SuperSTAR)

- One DB for each data source
- User-accessible databases
- Used to create reports for stand-alone data sources
- Registered with SuperSTAR server

Common Model

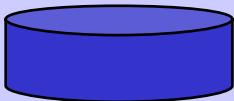

Common Model
(rel. DB)

- One DB design combining the different data sources in the dimensions
 - Time
 - Location (counting stations, O/D)
 - Vehicle type
- Intermediate storage for common SuperSTAR DB
- Relational database

Common Database (SuperSTAR)

Common DB
(SuperSTAR)

- User-accessible database containing the common model
- Used to create reports across and combining several data sources
- Registered with SuperSTAR server

Common Database (SuperSTAR)

Common DB
(SuperSTAR)

- Estimated goods distribution
Brenner 2004-06

Import process (I)

Import
SuperCHANNEL

- Relational source database
- SuperSTAR target database
- Definition of facts (counting variables)
- Definition of classifications (category variables)
- Defined with SuperCHANNEL

Import process (II)

Import
SuperCHANNEL

ETL process

ETL routines

- Relational source database or flat files
- Relational target database
- Extraction of data from source format (file formats, DB design)
- Transformation in target design (stand-alone, common designs)
- Loading of data to the target
- Defined with KETTLE

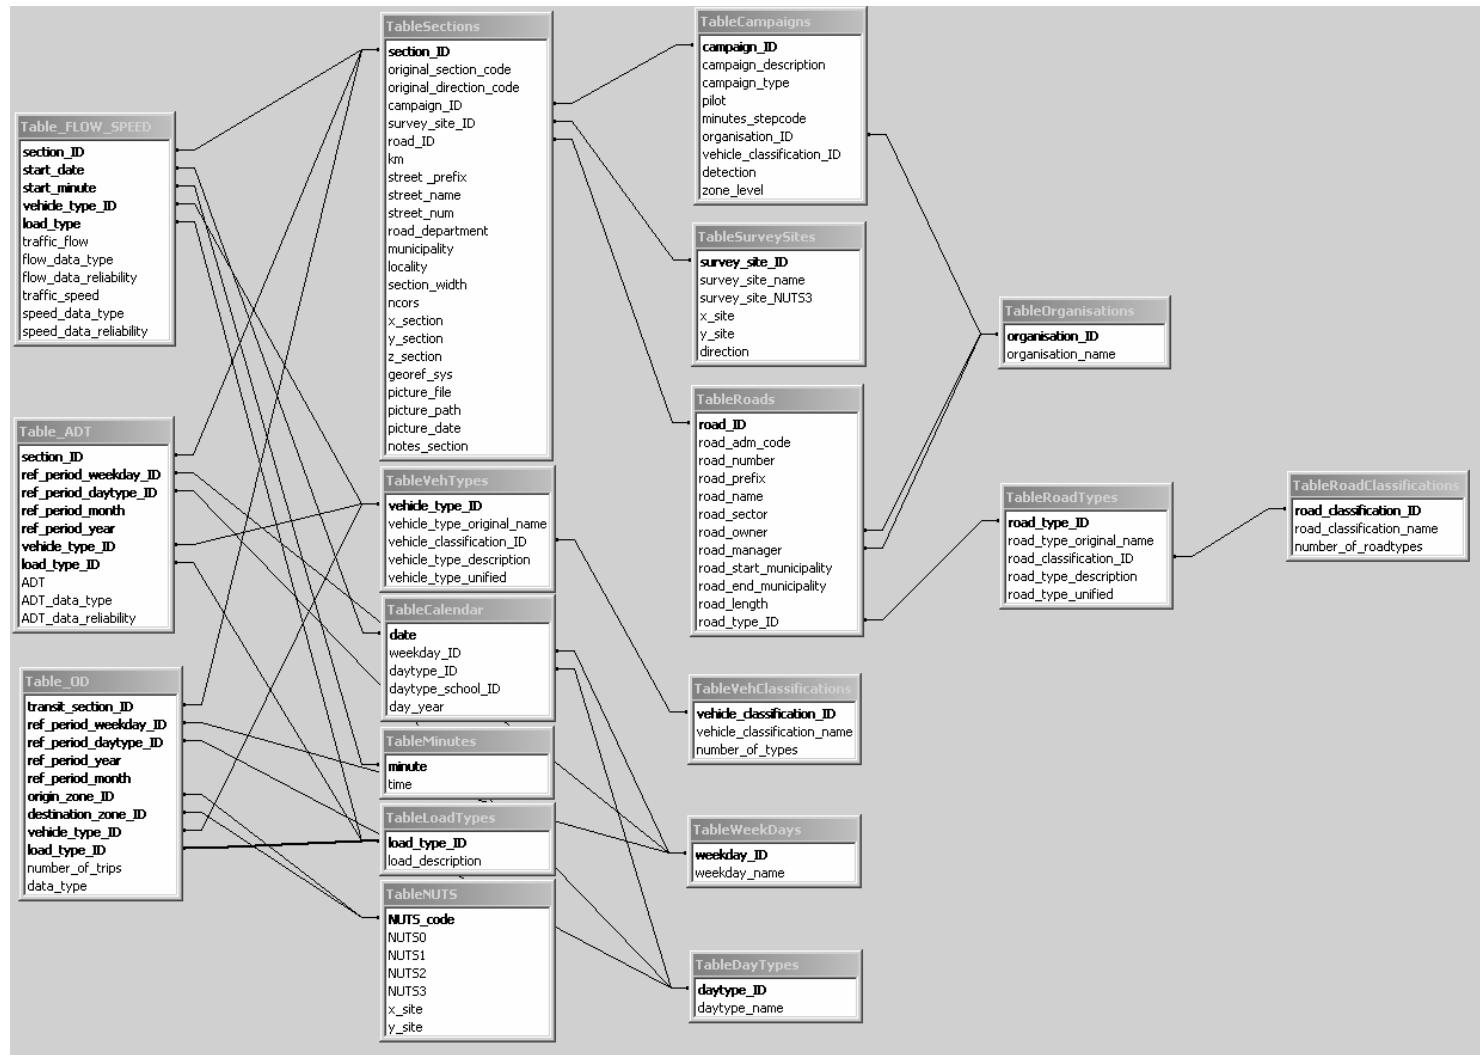

WP6 – Web application

- Objective:
 - Develop a tool which allow user to see (on a map) and offer possibility to extract (download) normalised data from DWH using Internet.
- Main requirements:
 - Data have to be georeferenced (suitable map)
 - user profile:
 - Very simple representation of data, few interaction with the system

Main characteristics of the web GUI database (1/2)

- Microsoft Access format (possibly converted to db2 format)
- ready for encompassing any type of traffic information databases
- 18 tables hosting information on:
 - georeferenced OD relations and traffic measures at different time steps
 - sections of measurement
 - vehicle types and classifications
 - load types
 - measurement campaigns and responsible entities
 - road types and classifications
- feeded through dedicated procedures for data conversion from Alpcheck DWH (according to the fields correspondence resulted from the origin DBs analysis)

Main characteristics of the web GUI database (2/2)

Main characteristics of the web GUI (1/3)

- Web application with map interface based on Google Maps (Javascript - PHP)
- Data extraction based on combo boxes and "cascade" selections
- Four data families:
 - day-based traffic
 - year-based traffic
 - ADT along years
 - OD matrices (NUTS0 to NUTS3 level based)

Main characteristics of the web GUI (2/3)

The screenshot shows a Mozilla Firefox browser window displaying the AlpCheck web application at <http://www.torino.csst.it/guiweb/index.htm>. The interface includes:

- AlpCheck logo:** Located in the top-left corner of the main content area.
- Traffic Counts tabs:** "Traffic Counts(day profile)", "Traffic Counts(year profile)", "AADT", and "AADT per Origin/Destination".
- Map interface:** A detailed map of the Alpine region (Italy, Switzerland, Austria, Slovenia, Croatia, and parts of France, Germany, and Monaco) with various cities labeled. It features zoom controls (+/-), a legend for "Mappa" (map), "Satellite" (satellite view), and "Ibrida" (hybrid view). A yellow arrow points from the text "Map interface" to the map area.
- Selection boxes:** A sidebar on the left contains several dropdown menus for filtering data:
 - Site: Select
 - Campaign: Select
 - Day Type: Any
 - Weeks Day: Any
 - Vehicle type: Any
 - Load Type: AnyA yellow arrow points from the text "Selection boxes" to this sidebar.
- Logos and Funders:** Logos for the European Union, Alpine Space, and Interreg IIIB are located in the bottom-left corner.
- Page footer:** Includes links for "Completo", "Start", "Mozilla Firefox", "Presentazioni", "Microsoft PowerPoint", "Risorse del computer", and "Floppy da 3,5 pollici (A:)".
- Page bottom:** Copyright notice: "© 2001-2006 INTERREG IIIB Alpine Space Programme Community Initiative Programme funded by the European Regional Development Fund".

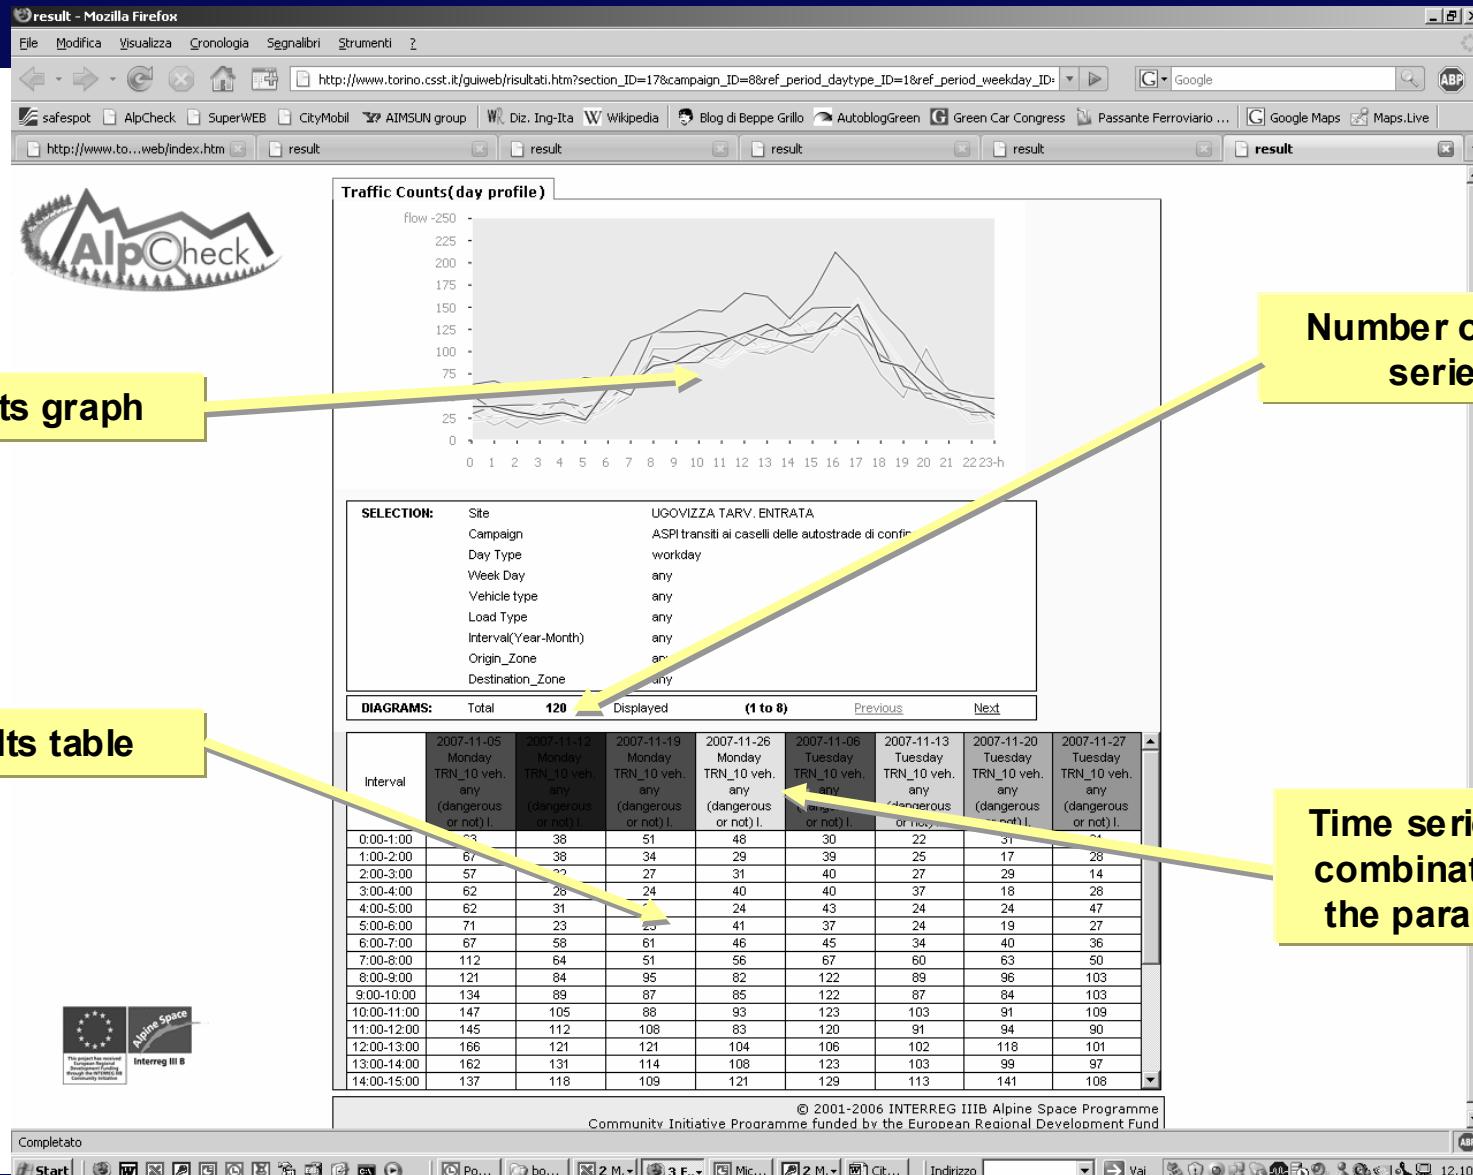

Main characteristics of the web GUI (3/3)

- Selectable parameters:
 - measurement site
 - data origin (measurements campaign)
 - day type (working day / holiday, etc.)
 - day of the week
 - vehicle type (aggregated according two macro types "light" and "heavy" vehicles)
 - load type (where available)
- Only the choices with available data are proposed to the user, avoiding "no data" results from the query
- Results request can be launched at any stage of the selection

Output (1/3)

- The results of the data inquiry are shown to the user in form of:
 - tables
 - graphs
 - map-based representations
- The result data series are disaggregated according to the available combinations of the selectable parameters
- The “dimension” of the results (number of time series, rows and columns of the OD matrices) varies according to selection stage at which the inquiry is launched

Output (2/3)

Output (3/3)

result - Mozilla Firefox

WP6 Web Application - Remarks

- a. The selection scheme is thought as a “cascade selection”, where the selection options for a certain category (scroll-down window) include only those for which the dat base effectively contains data. This assumes that for every selectin a query is automatically launched in order to extract the available items for the following selection in the sequencial “selection tree”.
- b. The selection options (windows and buttons) in step 2 and 3 may be activated or inhibited according to the chosen display mode, for representation clearness or conceptual reasons. For example: the “distinct category” option for the data source selection is not selectable for the ADT per Origin/Destination display mode; the ADT survey month, day and day type windows are inhibited if the ADT per year or per Origin/Destination has been selected.

WP6 – Web Application

- WB application now available on ALPCHECH Server for ALPCHECK community at:

<http://dh.alpcheck.eu/guiweb/index.htm>

Thank You for attention
